

Advanced MACD This is best used in a higher timeframe same goes for most strategy.

If you don't want to keep on looking at chart this maybe ideal for you. (for manual trading just set stoploss and take profit area)

For this strategy we will have to look for premium (resistance) and discount (support) zone.

Note: That both support and resistance are zone not an exact line but an area.

Once candle stick hit the support/resistance area wait for a reversal candle stick. Condition for this strategy are listed below.

Stoch RSI is at overbought/oversold and have crossed. MACD blue line have a big gap from the red line. (about to cross)

Volume decreasing.

Entry - At 2nd candle after reversal candle enter short if hits resistance and long if it hits support

Exit - Stoploss higher than the reversal candle to give it a little room for volatility and Take Profit on Support/Resistance. (These both should be changeable)

Depends on your risk appetite.
